Lisa:

Circling back on question(s) about ammonia detection at the incident scene and what would be levels of concern the information below was developed by our HQ EOC folks and circulated through the R6 REOC personnel.

West Fertilizer, Inc, Explosion in West, Texas

Around midnight, CDT on April 17, EPA's Airborne Spectral Photometric Environmental Collection Technology (ASPECT) aircraft flew 21 runs over the incident site; data on the plume was available within 5 minutes. Readings were 6 to 10 ppm ammonia concentration within the plume, however, the plume dissipated rapidly due to high winds. Approximately ½ mile downwind, during the same runs, ASPECT did not detect ammonia.

People exposed to levels of ammonia up to 100 ppm are likely to experience significant irritation to their eyes, nose and throat, but no lasting harm. Ammonia is extremely pungent and may be immediately sensed at levels far below 100 ppm.

ASPECT is currently awaiting clearance to fly missions today. At the moment, the weather is poor. When they do fly today, they will be collecting photographic data as well as collecting additional data from the plume.
